Water Pipe Restoration

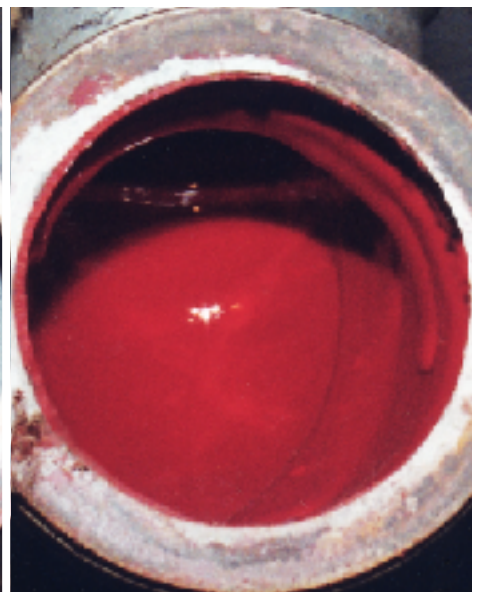

no need to replace old pipes,
simply renew them.

Old

Cleaned

Coated & sealed

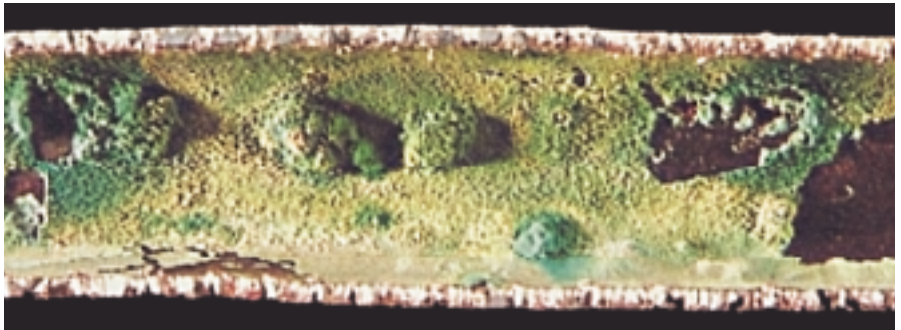

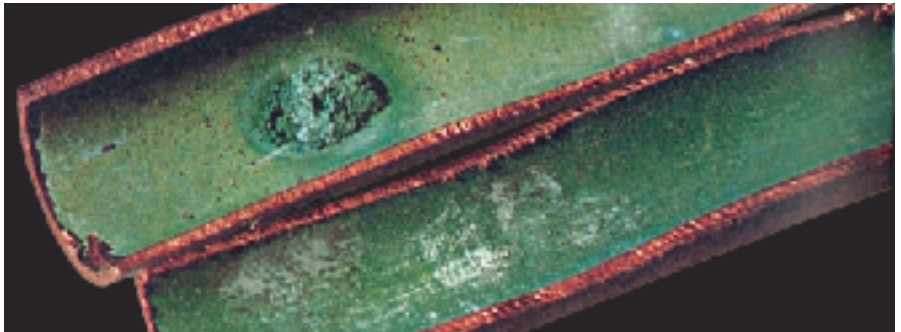

Eliminate the need to replace old corroded pipes.

The Promotec[®] Sytem restores water pipes by removing corrosion, limestone, rust and impurities from the inside of the pipe without any major structural work.

The problem

Why do pipes corrode?

Galvanized or brass pipes and copper tubing have scale buildup caused by various factors such as calcium, hard water, rust and lime etc. The results of these buildups are reduced water flow, rusty or dirty water, pipe leaks or breaks and usually lead to very high replacement costs of these corroded pipes throughout an entire building.

Replacement cost !

Replacement requires not only new pipes, it also means major repair work such as the opening of walls, removal and replacement of the old pipes, closing and rendering the opened walls. At the same time the water supply must be shut off to the whole building during the replacement work.

If you are faced with a repiping problem of this type, there is now a better and far less costly way to achieve this !

The solution

The Promotec® System

We remove all the scale and residue down to the original pipe surface, see pictures 1 & 2

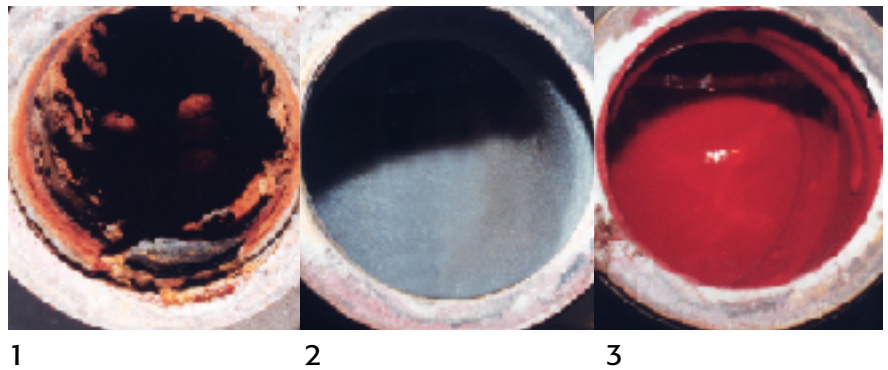

The cleaned pipe interior is then coated and sealed with an epoxy as a protective and long lasting barrier coating for drinking water, see picture 3

The two-part epoxy is a NSF certified product and complies with the NSF/ANSI 61-Standard, (National Sanitation Foundation), the most stringent domestic water testing standard in the world

The renovated pipe with the epoxy coating is as good as a brand new pipe and will last even longer than a new pipe.

We guarantee the epoxy coated pipe for a period of 10 years which is longer than the usual pipe guarantee.

The Promotec process is clean without opening and replacing walls and assures a minimal shutdown of the water supply.

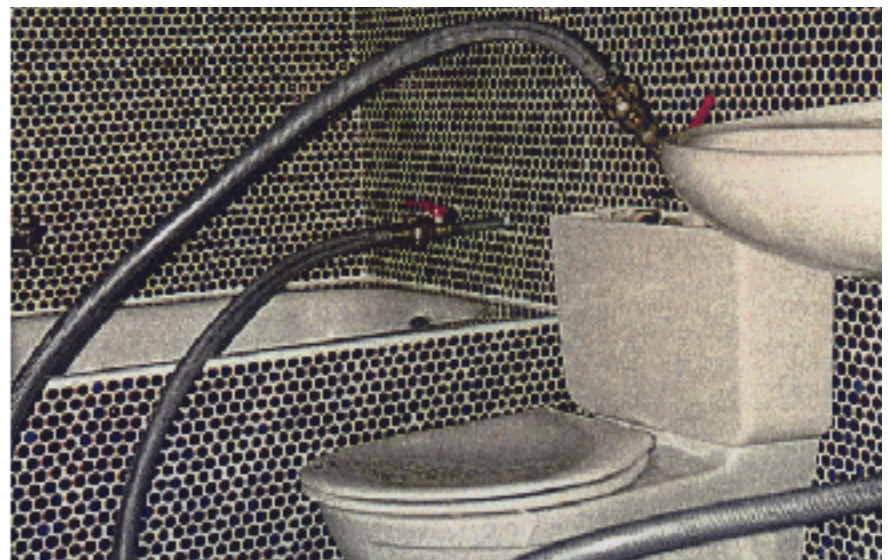

The advantages

The most important advantage of the Promotec System is the cost factor which is minimum 30 to 60 % less than classic pipe replacement.

The renovation time is far shorter.

There is no interruption in the water supply, no noise, and no dust, as such the inconvenience and disruption to tenants is minimalized.

Safety as the new inner epoxy pipe is protected by the old steel or copper pipe.
